7 GLOSSARY 10

1 INTRODUCTION

This Test Plan outlines the strategy for verifying the **Core Functional Modules** of the **Moodle 5.1** Home Page and Dashboard. The focus is to validate that each of the four distinct roles(**Admin, Manager, Teacher, and Student**) can execute their specific management and learning tasks accurately while maintaining strict permission boundaries.

1.1 PURPOSE AND SCOPE

The purpose of this document is to communicate activities related to the planning, staffing, managing, and execution of testing activities for the **Moodle 5.1 Core Implementation** project.

This document focuses on:

- Overall testing strategy for the stable core environment.
- Levels of testing to be performed (Functional and User Acceptance Testing).
- Entry and Exit criteria for each test level to ensure quality gates are met.
- Supporting testing tools used for defect tracking and documentation.
- Roles and Responsibilities of the supporting testing resources .
- System resources required for the test environment.
- Assumptions and risks associated with the testing phase.

1.2 OUT OF SCOPE

To maintain a focused testing phase, the following areas are excluded:

- **Mobile Applications:** Testing is restricted to the web browser interface; native iOS/Android apps are not included.
- **Third-Party Integrations:** Any non-core plugins, external themes, or custom-coded add-ons.
- **Infrastructure & Load Testing:** Server-side performance tuning and high-concurrency stress testing.
- **Legacy Migration:** The process of moving historical data or users from previous versions of Moodle.

2 TEST STRATEGY

This section addresses test level selection, characteristics and testing tools

2.1 TEST LEVEL SELECTION

This section contains specific information relating to the selection of the test levels. Refer to the testing guidelines document for the objective and detailed description of each test level.

Test Level	Applicable?	Rationale for omitting test level
Functional Test	☑ *Yes* ☐ *No*	Covers all core Moodle features to ensure they work as expected.
Smoke Test	☑ *Yes* ☐ *No*	Quick check to ensure the main functions of Moodle are stable before detailed testing.
Exploratory Test	☑ *Yes* ☐ *No*	Tester explores the system creatively to find unexpected issues not covered by scripted tests.

2.2 TEST LEVEL CHARACTERISTICS

Test Level	Owner	Planned Iterations	Entry Criteria	Exit Criteria
Functional Testing	QA Team	3	Test environment is ready and test accounts are available	All functional test cases are executed and critical defects are reported
Smoke Testing	QA Team	1	A new build of the system is available	Main functions of the system work correctly
Exploratory Testing	QA Team	2	Functional testing is completed	Any discovered defects are reported

Entry Criteria	***The Moodle demo environment is accessible and working.*** ***Test accounts for different roles (student, teacher, manager,admin) are available.*** ***The test cases have been prepared***
Exit Criteria	***All test cases have been executed*** ***Any critical defects found during testing have been reported*** ***The Test Summary Report is prepared***

2.3 TEST SCOPE

Test Level	In Scope	Out of Scope
Functional Testing	**User Management:** Creating, editing, and deleting accounts; assigning roles. **Course Architecture:** Creating training programs and building course shells **Content Management :** Uploading files, lessons, and setting up activity modules (Quizzes/Assignments).	Source Code Review and Database Logic.
Smoke Testing	Quick checks of main Moodle functions to ensure the system is stable before detailed testing.	Security testing and Server-side hardware or network configuration testing.
Exploratory Testing	Tester explores the system creatively to find unexpected issues not covered by scripted tests.	System-level integration, security, or server/network testing.

2.4 REFERENCES

DOCUMENT	LINK
Moodle 5.1 Official Documentation	MoodleDocs
SRS	SRS
Traceability Matrix	RTM

2.5 TESTING TOOLS

Test Level	Tool(s)	Tool supporting Needs
Functional Testing	Microsoft Excel , Trello	Used to write and organize test cases and track testing tasks.
Smoke Testing	Microsoft Excel , Trello	Used to quickly track basic checks of the main system functions.
Exploratory Testing	Trello, Jira	Used to document issues and capture evidence while exploring the system.

3 ROLES AND RESPONSIBILITIES

Role/ Group	Responsibilities	Name
Test Team / Testers:	*Responsibilities:* ● *Observe and note any issues or bugs during testing* ● *Execute all tests on Moodle (modules, features, assignments)* ● *Ensure each feature works as expected* ● *Help coordinate testing tasks among the team*	**1)Salah aldin** **2)Moonera Al-Mashni** **3)Rosan AbuKwaik** **4)Heba Basil**
Team Coordinator / Lead Tester	*Responsibilities:* ● *Assign test tasks to team members* ● *Track progress of testing activities* ● *Summarize issues and test outcomes for the team* ● *Help solve blockers during testing*	
User Simulation / End-User Tester	*Responsibilities:* ● *Test the system from an end-user perspective* ● *Ensure that features are easy to use* ● *Provide feedback on user experience and interaction with Moodle*	

4 TEST ENVIRONMENT AND RESOURCES

The following table is used to identify the system resources (hardware, software etc. required for the test environment needed to support each test level.

4.1 ENVIRONMENT ACCESS

Environment	Group	Reason for Access
Moodle Demo Environment	Test Team	Execute functional test cases and verify Moodle features.
	Test Team	Perform smoke testing to ensure the main system functions are working.
	Test Team	Perform exploratory testing to discover unexpected issues.
Project Tools (Excel, Trello)	Team Coordinator / Lead Tester	Manage test cases, assign tasks, and track testing progress.

4.2 TEST DATA ACQUISITION

The following table is used to identify the approach for acquiring and securing the test date to be used for each test level.

Source of Test Data	Extraction approach	Type of test data (input or pre-existing)	Security controls
Moodle Demo Preloaded Courses	*Use directly from Moodle demo*	*Pre-existing*	*Public demo data, no sensitive info*
Demo Student Accounts	Provided in Moodle demo	Input	Accounts safe to use, no real personal data
Sample Assignments & Quizzes	Create manually in demo courses	Input	Only test data, no real info
Only test data, no real info	Enter manually during testing	Input	Only for testing, no real data

5 TEST ASSUMPTIONS AND RISKS

5.1 ASSUMPTIONS

This section lists assumptions that are specific to the test planning.

#	Assumption
1	*The Moodle demo website is available and accessible during testing*
2	*Test user accounts for all roles are available*
3	*Testers have stable internet connection to access the system*
4	*The system features required for testing are enabled and working*

5.2 RISKS

The following risks to the testing plan have been identified and the supporting contingency plan included to mitigate their impact on the project. The impact (or severity) of the risk is based on how the project would be affected if the risk was triggered. The trigger is the milestone or event that would cause the risk to become an issue to be addressed.

#	Risk	Impact	Trigger	Mitigation/ Contingency Plan
1	Moodle server downtime	Testing activities stop	Server becomes unavailable	Coordinate with admin to restore server
2	Internet connectivity issues	Delay in executing test cases	Network instability	*Use alternative internet connection*
3	Browser compatibility issues	Some features may fail	Feature works in one browser but not others	Test on multiple browsers
4	*Performance issues with many users*	Slow system response	High number of concurrent users	Conduct performance testing

6 TEST REPORTING

Standard data capture:
Following data fields will be collected for all test cases and results:

- Test Case ID
- Description
- Status:
- Defects ID
- Detected ON
- Severity Level
- Detected By
- Closed ON

7 GLOSSARY

Item	Description
Black box testing	Focus is on the external attributes and behavior of the software. Such testing examines the software from the user perspective. UAT is the classical example of this type of testing
Defect	A defect is a flaw, error or omission identified during the testing process. Defects are typically classified by level of severity ranging from non-critical to "show stopper"
Negative Testing (destructive)	Testing attempts to prove that the software can be broken using invalid or erroneous input conditions. Both defined and undefined error conditions should be generated.
Positive Testing	Testing attempts to prove that the software satisfies the requirements
Test Case	A test case is a specific test designed to verify a particular condition or requirement. It identifies input data with predicted results and describes the testing objective.
Test Script	Provide the step by step procedures comprising the actions to be taken and the verification of the results
Exploratory Testing	type of testing where the tester explores the system and tries different actions to find bugs without following predefined test cases
Functional Testing	Checks if the system works according to requirements
Smoke Testing	Quick check to make sure the main functions work before detailed testing.
