Introduction

What is Moodle?

- Moodle is an online learning platform.
- It helps teachers manage courses online.
- Students can access materials and submit assignments.
- It supports quizzes, grades, and communication.

Overview of Roles and Our Work →

The project covers:

- Course / Project Presentation
- About Moodle platform
- Roles: Admin – Manager – Teacher – Student
- Relation between roles

Our Testing Process

During this project we worked as a QA team to test the Moodle system.

Steps we followed:

1. Analyze system requirements.
2. Write SRS document and test plan.
3. Create RTM (Requirement Traceability Matrix)
4. Design Test Cases for each role.
5. Execute test cases.
6. Identify and report bugs.

Types of Testing We Performed →

During our work we applied several testing types:

- Functional Testing
  To verify that system features work correctly.
- Smoke Testing
  To check the basic functions of the system.
- Exploratory Testing
  To discover unexpected bugs while using the system.

These tests helped us cover different parts of the system.

Tools We Used

We used several tools to manage the project:

Jira

- Used for bug tracking
- Reporting and managing issues

Trello

- Used to organize tasks for each role
- Track project progress

Zephyr

- Used to create and manage test cases
- Execute tests and record results

These tools helped organize our testing workflow.

Test Case ID	TC_T_01
Summary	Teacher Login
Preconditions	Teacher account exists
Test Data	Email: teacher@test.com Password: Test123
Steps to Reproduce	1. Open Moodle website 2. Enter credentials 3. Click Login
Expected Result	Teacher dashboard displayed
Actual Result	Teacher dashboard displayed
Status	Passed

Testing the Roles in Moodle

In our project we tested the system based on different user roles.

For each role we checked:

- Access permissions
- Available features
- User actions and workflow
- Possible bugs

Admin Role

The Admin manages the whole system.

Main responsibilities:

- Manage users and roles
- Control system settings
- Manage courses and permissions
- Maintain the platform

Testing Admin Features

We tested the Admin role by checking:

- Creating new users
- Assigning roles to users
- Adding new courses
- Managing system settings

We also checked if Admin has full access to all system functions.

Manager Role

The Manager organizes courses in the system.

Main tasks:

- Create and manage courses
- Organize course categories
- Assign teachers to courses
- Monitor course activity

Testing Manager Features

For the Manager role we tested:

- Creating courses
- Managing course categories
- Assigning teachers to courses
- Viewing course reports

We verified that the Manager cannot change system settings like the Admin.

Teacher Role

Teachers manage course content and student learning.

Main tasks:

- Upload course materials
- Create quizzes and assignments
- Grade student submissions
- Communicate with students

Testing Teacher Features

We tested Teacher actions such as:

- Adding course materials
- Creating quizzes and assignments
- Grading student work
- Viewing student submissions

We also checked if teachers can edit course content.

Student Role

Students use Moodle to access learning materials.

Main activities:

- View course materials
- Submit assignments
- Take quizzes
- View grades and feedback

Testing Student Features

For the Student role we tested:

- Accessing course materials
- Submitting assignments
- Taking quizzes
- Viewing grades

We ensured students can only access their own course activities.

Execution Summary

9

Bugs

Conclusion

- Moodle supports different roles with different permissions.
- Testing each role helps ensure the system works correctly.
- Our project helped us understand how users interact with the platform.

Test Cases and Bugs

During testing we created multiple test cases for each role:

Results of testing:

- Several test cases were executed successfully
- Some bugs were discovered and reported
- Bugs were documented in Jira Bug Reports

This helped improve system quality.
